

# Data Exchange

# Agenda

## > Define your Data Exchange/Management scenario

- > 3 exchange scenarios
- > Project and model management
- > Blueprint of your solution

## > Model API starting guide

- > Knowing the basic concepts
- > Model objects and data traversing
- > Optimization
- > Resource and help

# Data Exchange Scenarios

## > File Exchange

- > Read/Write data to various file formats
- > Industry standards
- > Proprietary formats

## > Database & Repository Exchange

- > Read/Write data to external Database systems

## > Direct-Link Exchange

- > Exchanging model data in real time with other applications
- > Direct integration with other API, SDK

## Scenario 1- File Exchange

USE CASE

- > Formats not supported in Tekla Structures
- > Contractual agreement or IPD process requirement

### > Industry Standards

- > IFC, ISO-15926, AecXML

International  
Organization for  
Standardization

### > Industry Initiatives & Projects

- > CSI Classification Systems:  
OminClass, Master/Unit Formats
- > FM and Commissioning - COBie2
- > Other Industry consortium

### > Proprietary formats

- > Other software native formats  
Fabtrol KISS, CNC Fabrication formats, ....  
aSa rebar fabrication format
- > General CSV file exchange
- > General XML file exchange

## Scenario 2- Database Exchange

- > Linking to your ERP or MIS Systems
- > Create daily dashboard-like summary
- > Integration with in-house DB solution
- > Project Data on mobile or handheld devices

### > Example extensions from US Solution Team

- UDA List
- Data Exchanger

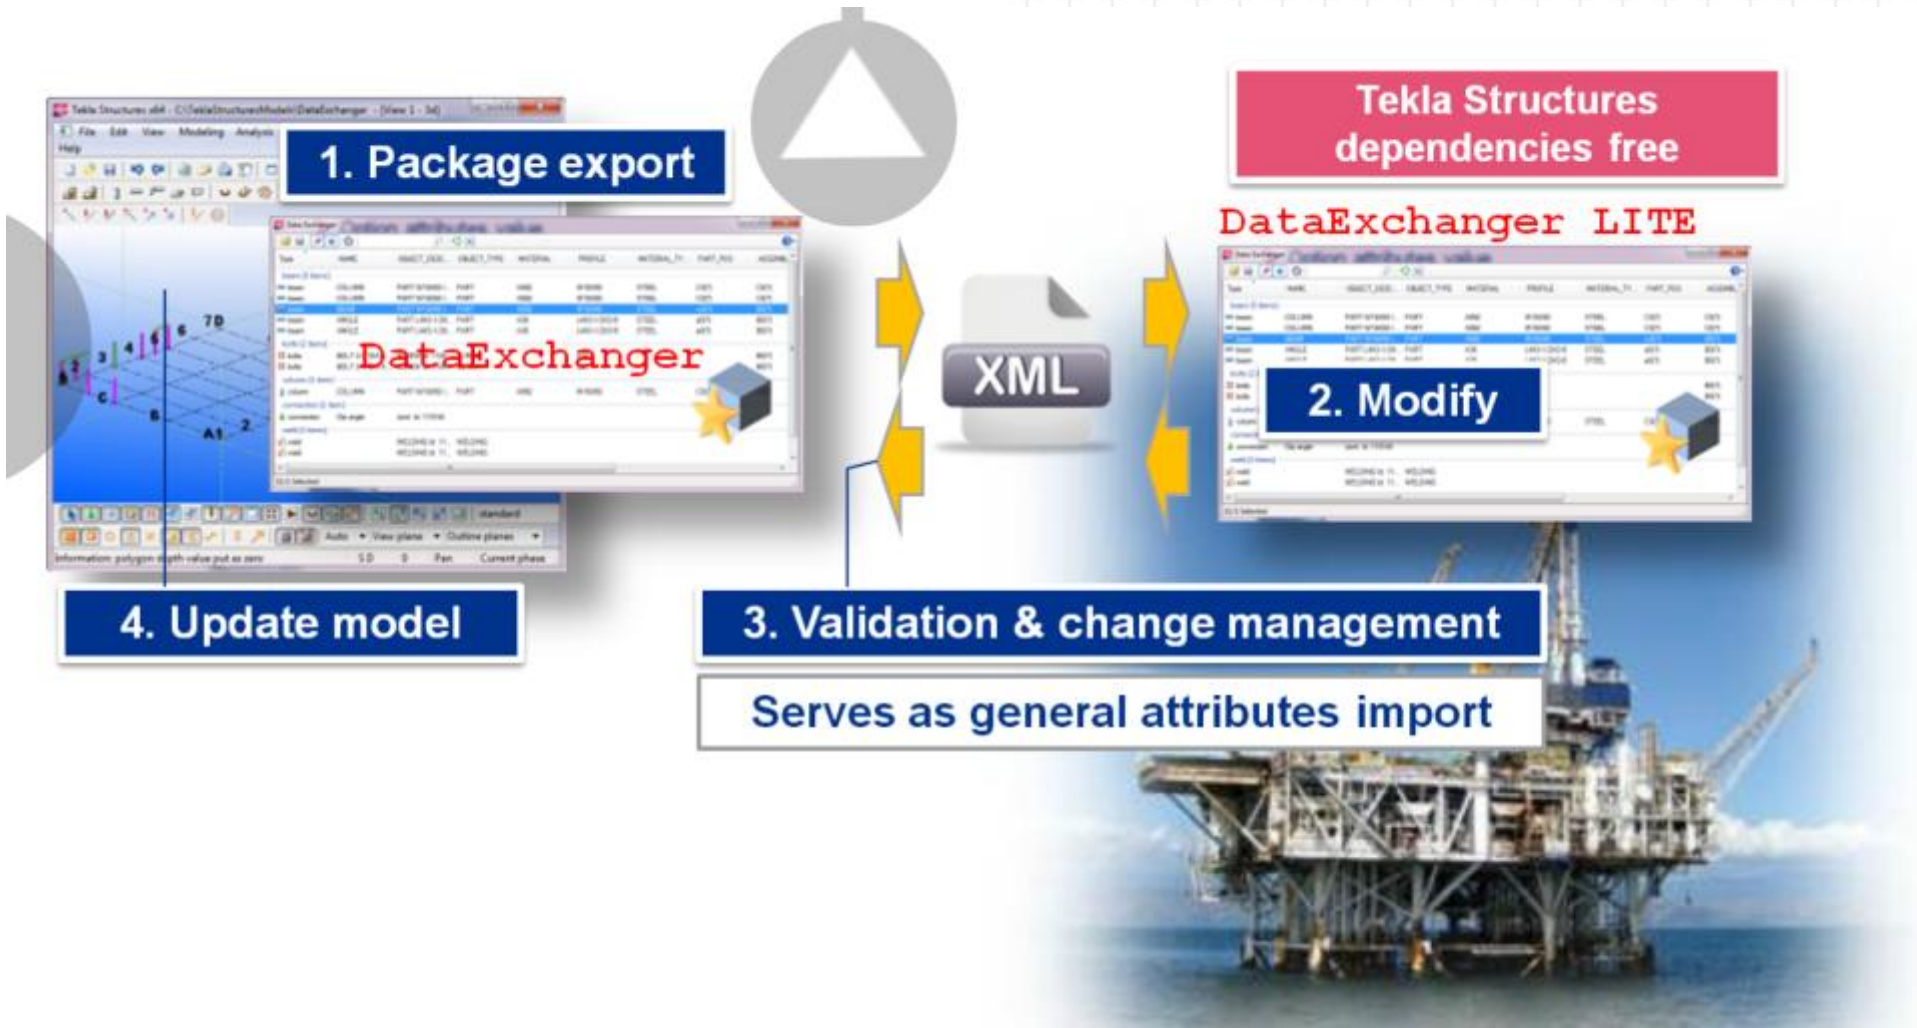

### > UM2010 Presentation-"Steel Design Work Process"

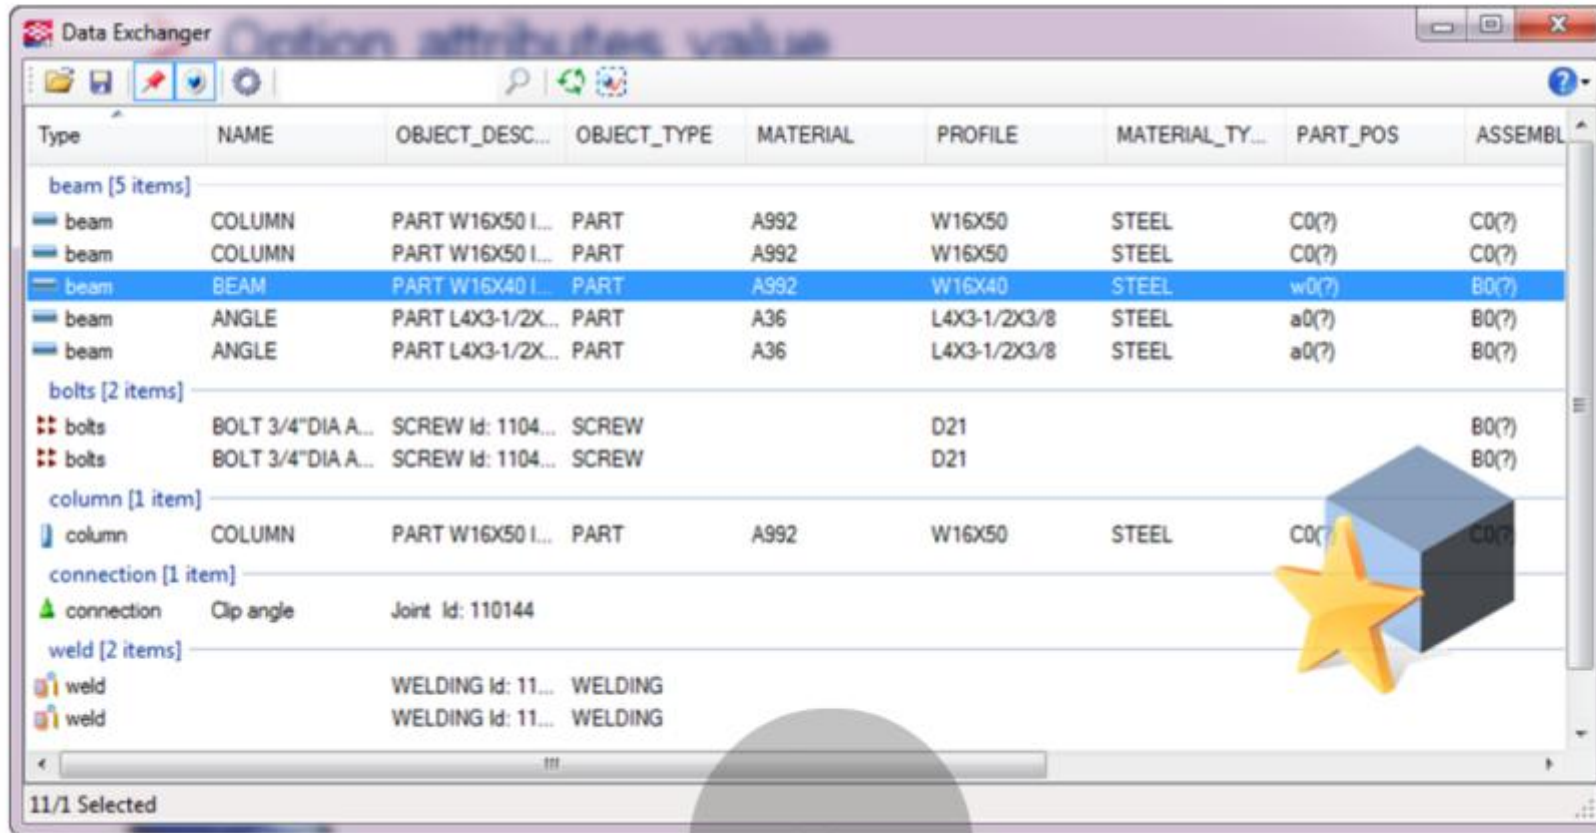

USE CASE

EXAMPLE

# Data Exchanger

The screenshot shows the 'Data Exchanger' application window. It contains a table with the following columns: Type, NAME, OBJECT\_DESC..., OBJECT\_TYPE, MATERIAL, PROFILE, MATERIAL\_TY..., PART\_POS, and ASSEMBL. The table is grouped into sections: beam [5 items], bolts [2 items], column [1 item], connection [1 item], and weld [2 items]. The 'beam' section is expanded, showing five rows. The third row is selected, highlighting the 'BEAM' type. A yellow star icon is overlaid on the right side of the table.

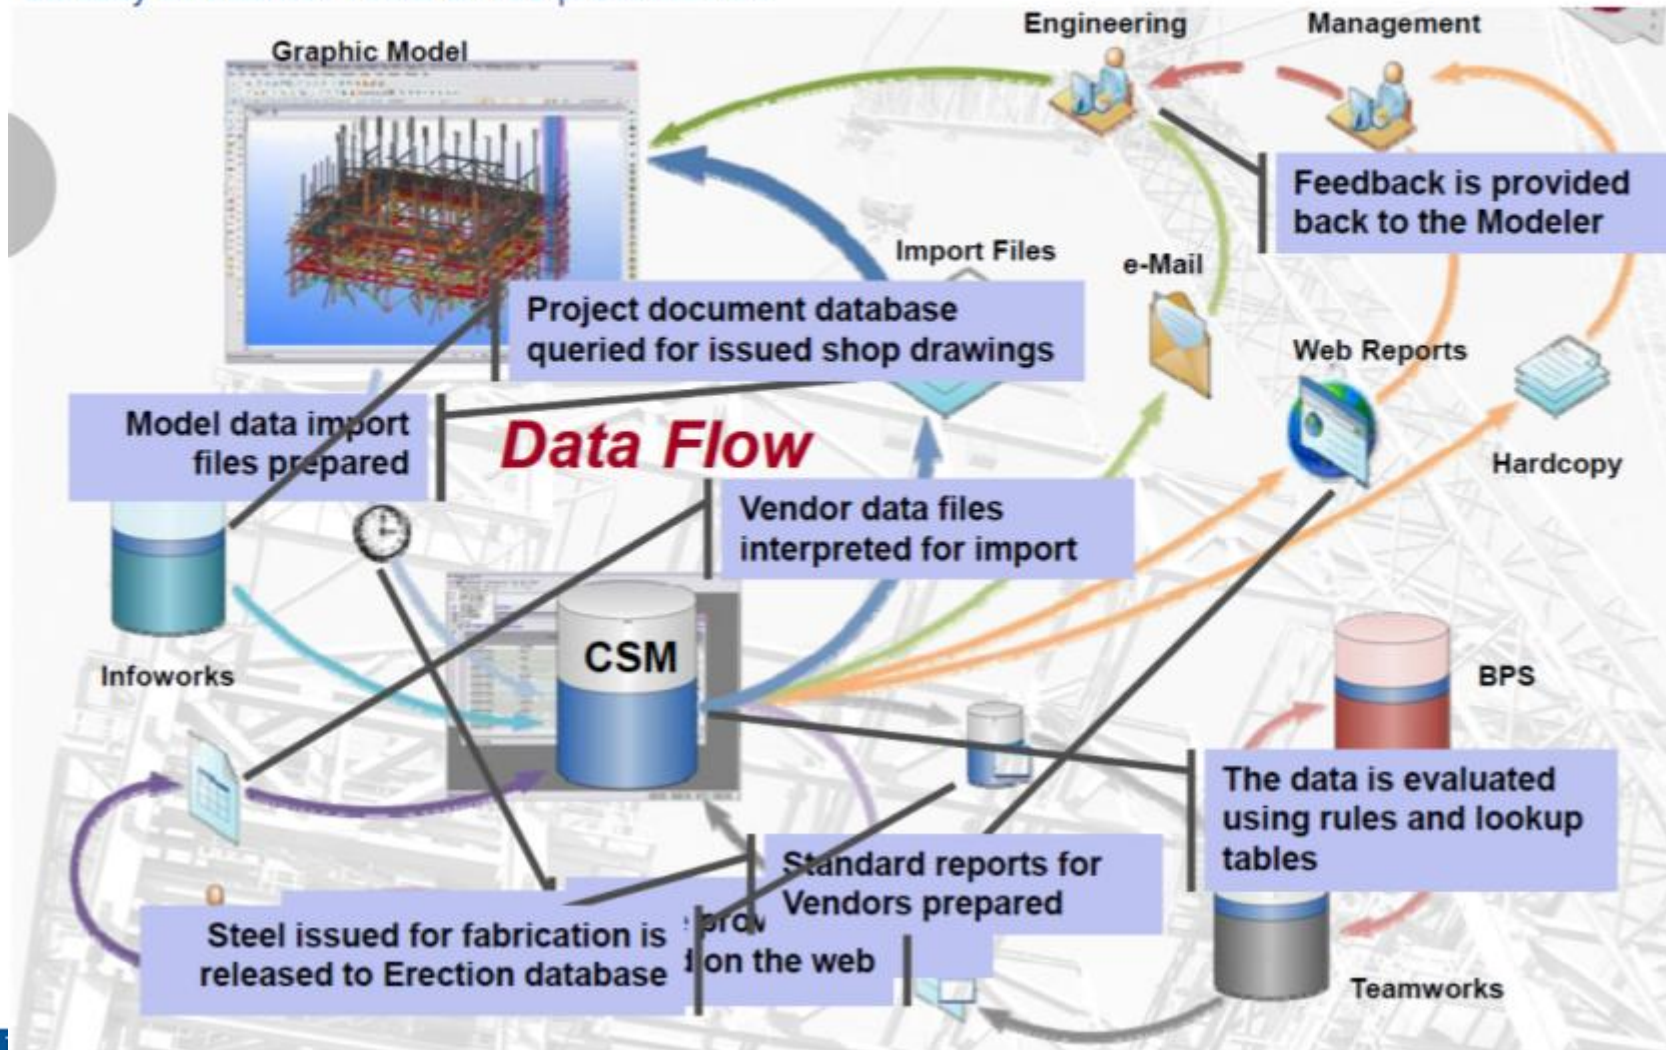

Type	NAME	OBJECT_DESC...	OBJECT_TYPE	MATERIAL	PROFILE	MATERIAL_TY...	PART_POS	ASSEMBL
beam [5 items]								
beam	COLUMN	PART W16X50 I...	PART	A992	W16X50	STEEL	C0(?)	C0(?)
beam	COLUMN	PART W16X50 I...	PART	A992	W16X50	STEEL	C0(?)	C0(?)
beam	BEAM	PART W16X40 I...	PART	A992	W16X40	STEEL	w0(?)	B0(?)
beam	ANGLE	PART L4X3-1/2X...	PART	A36	L4X3-1/2X3/8	STEEL	a0(?)	B0(?)
beam	ANGLE	PART L4X3-1/2X...	PART	A36	L4X3-1/2X3/8	STEEL	a0(?)	B0(?)
bolts [2 items]								
bolts	BOLT 3/4"DIA A...	SCREW Id: 1104...	SCREW		D21			B0(?)
bolts	BOLT 3/4"DIA A...	SCREW Id: 1104...	SCREW		D21			B0(?)
column [1 item]								
column	COLUMN	PART W16X50 I...	PART	A992	W16X50	STEEL	C0(?)	C0(?)
connection [1 item]								
connection	Clip angle	Joint Id: 110144						
weld [2 items]								
weld		WELDING Id: 11...	WELDING					
weld		WELDING Id: 11...	WELDING					

## Multiple Database and In-house ERP System Integration

- > Tekla User In-house Database Integration

# Blueprint of your Data Exchange and Project Management Solution

# Linking to Your ERP or MIS System

*Figure 5 B2B integration platform for ERP, MRP, MIS & eCommerce solutions*

## Knowing the Concepts

### > Simple data structure in Model API

A model is a collection of **Model Objects**, both native and reference

### Model Object

- 1 Object Types  
Sub-types of model objects in Model Open API  
Class - A simple class example

- 2 Object Properties

- User Property (UDA)  
e.g. User Field 1
- Report Property  
e.g. Part Solids
- [API] Class Properties

A model is a collection of  
**Model Objects**, both native and reference

## Model Object

- 1 Object Types  
Sub-types of model  
objects in Model Open API

Polymorphism & Inheritance

### Class- A simple class example

#### > Object Oriented Programming

Metaphysics - Aristotle (428/427-322 BC)

**Object**  
Abstract Class  
Model Object is inherited from  
Microsoft .NET "Object" class

- 2 Object Properties

- User Property (UDA)

- Report Property

1

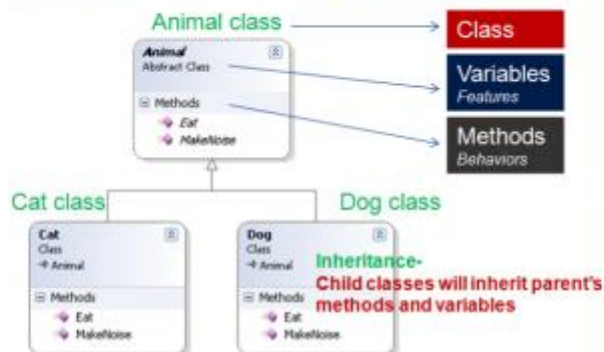

# Object Types

## Sub-types of model objects in Model Open API

Polymorphism & Inheritance

### Class- A simple class example

> Object Oriented Programming

Frank Wang

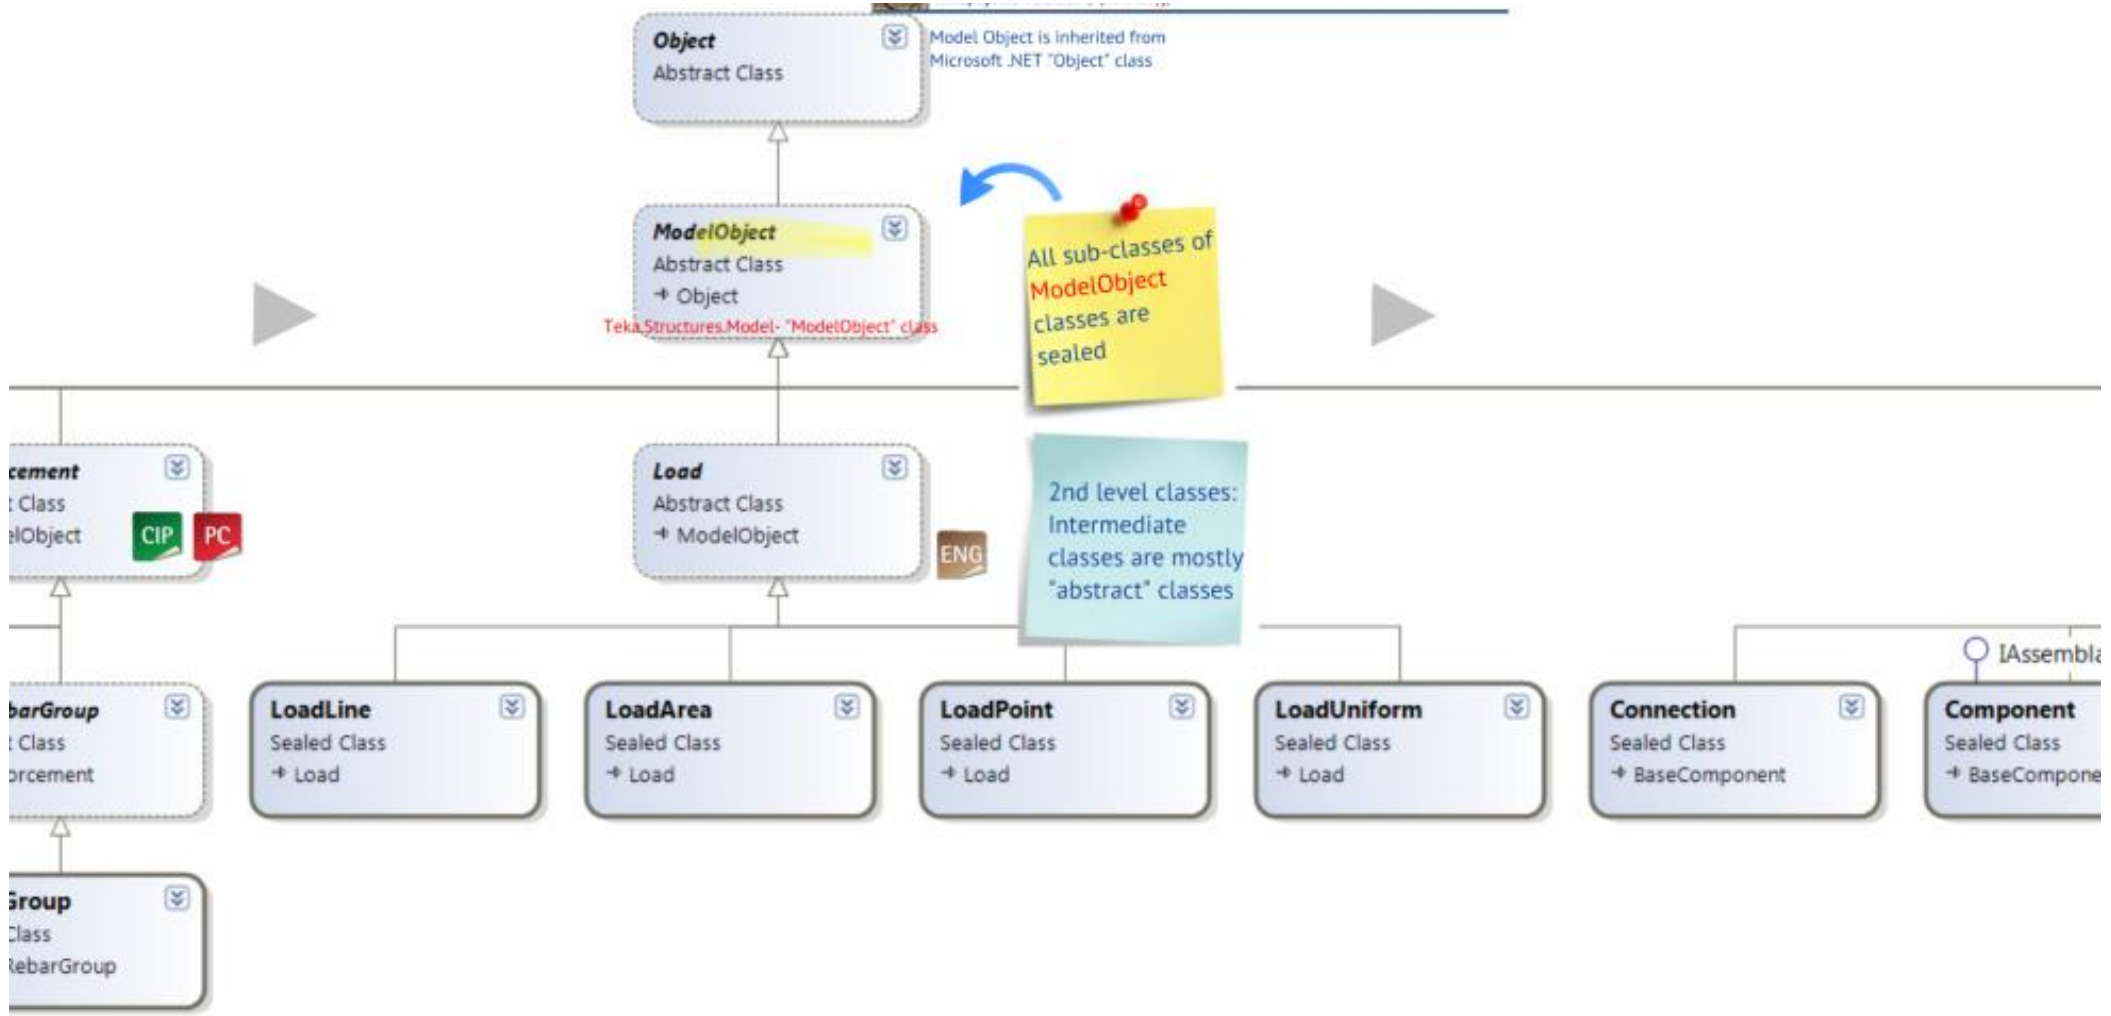

Metaphysics -Aristotle (Αριστοτέλης)

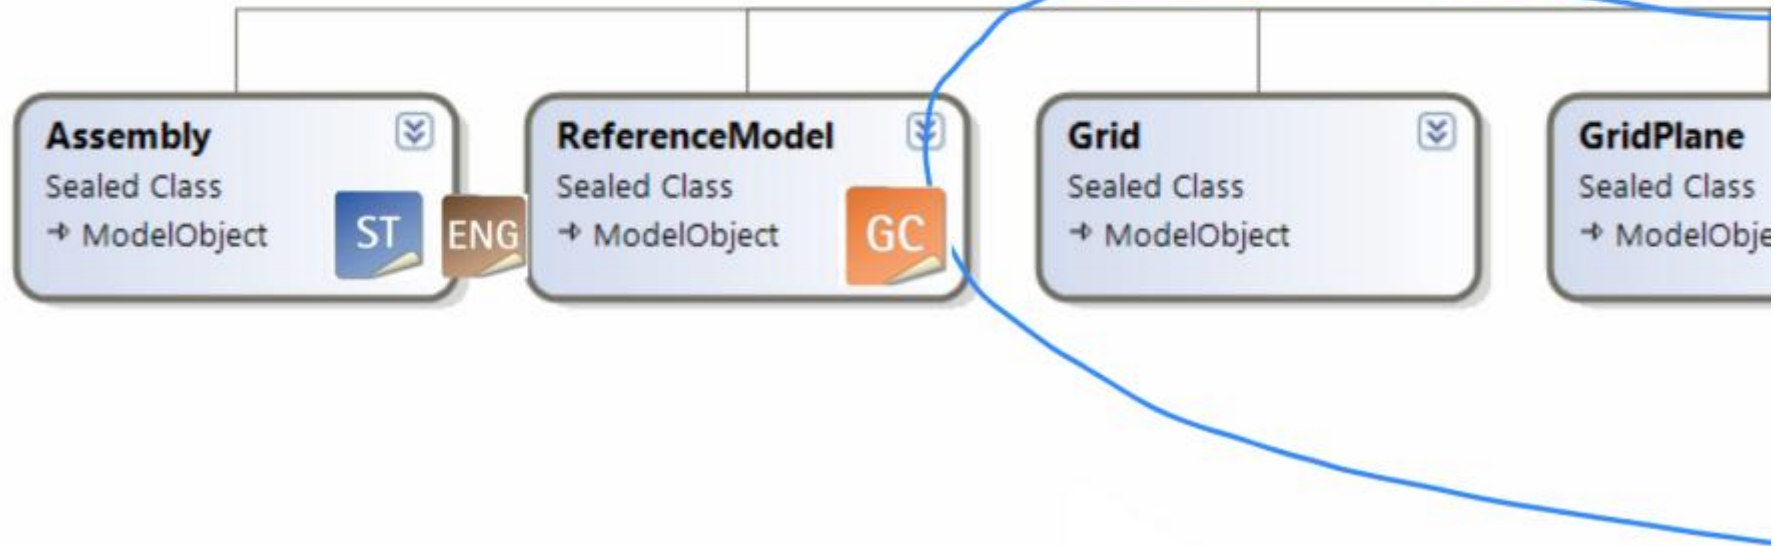

**Object**  
Abstract Class

Model Object is inherited from Microsoft .NET "Object" class

Start here

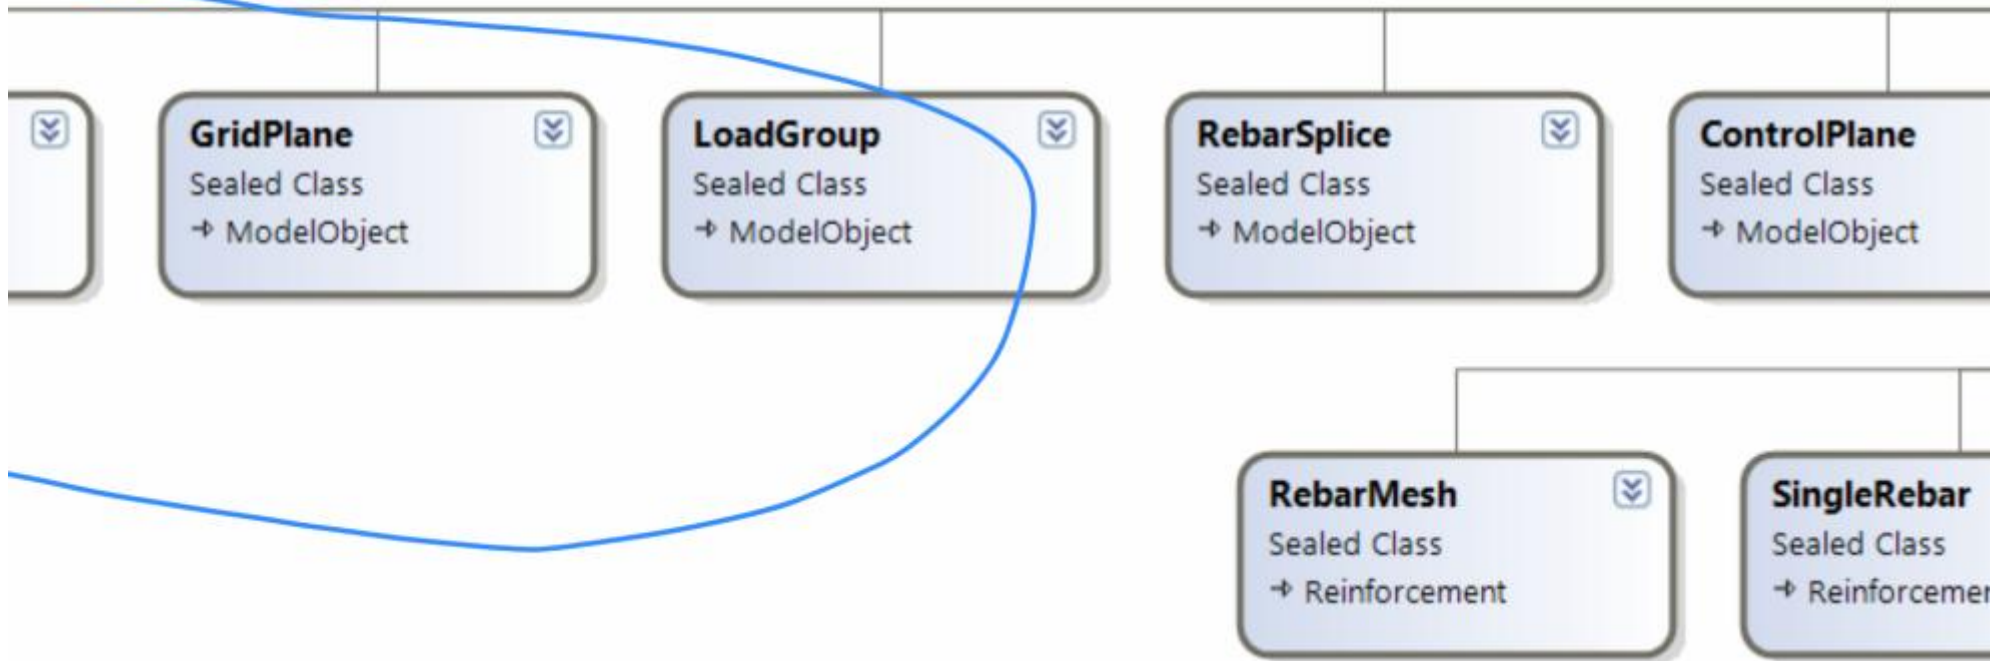

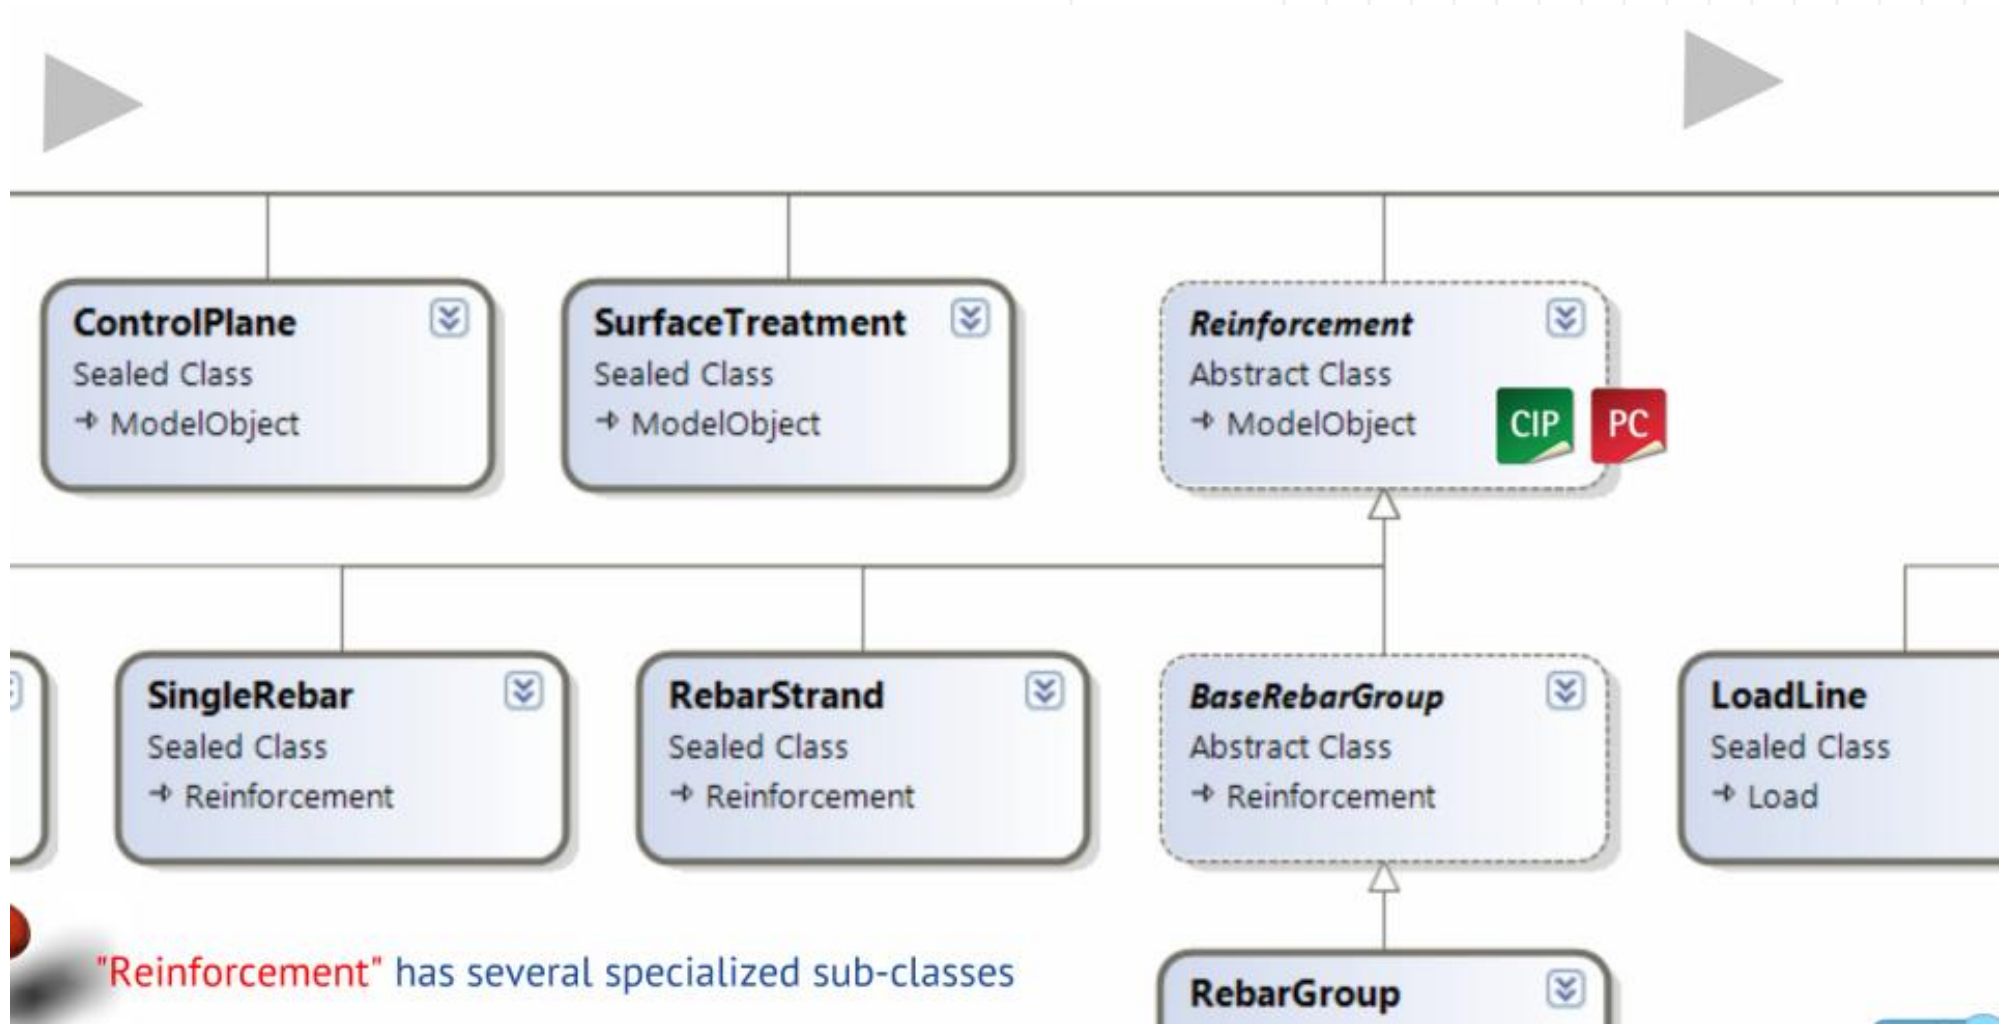

Yes,

- 1) grid and grid plane,
- 2) load, load group

are all model objects that are accessible in Model API

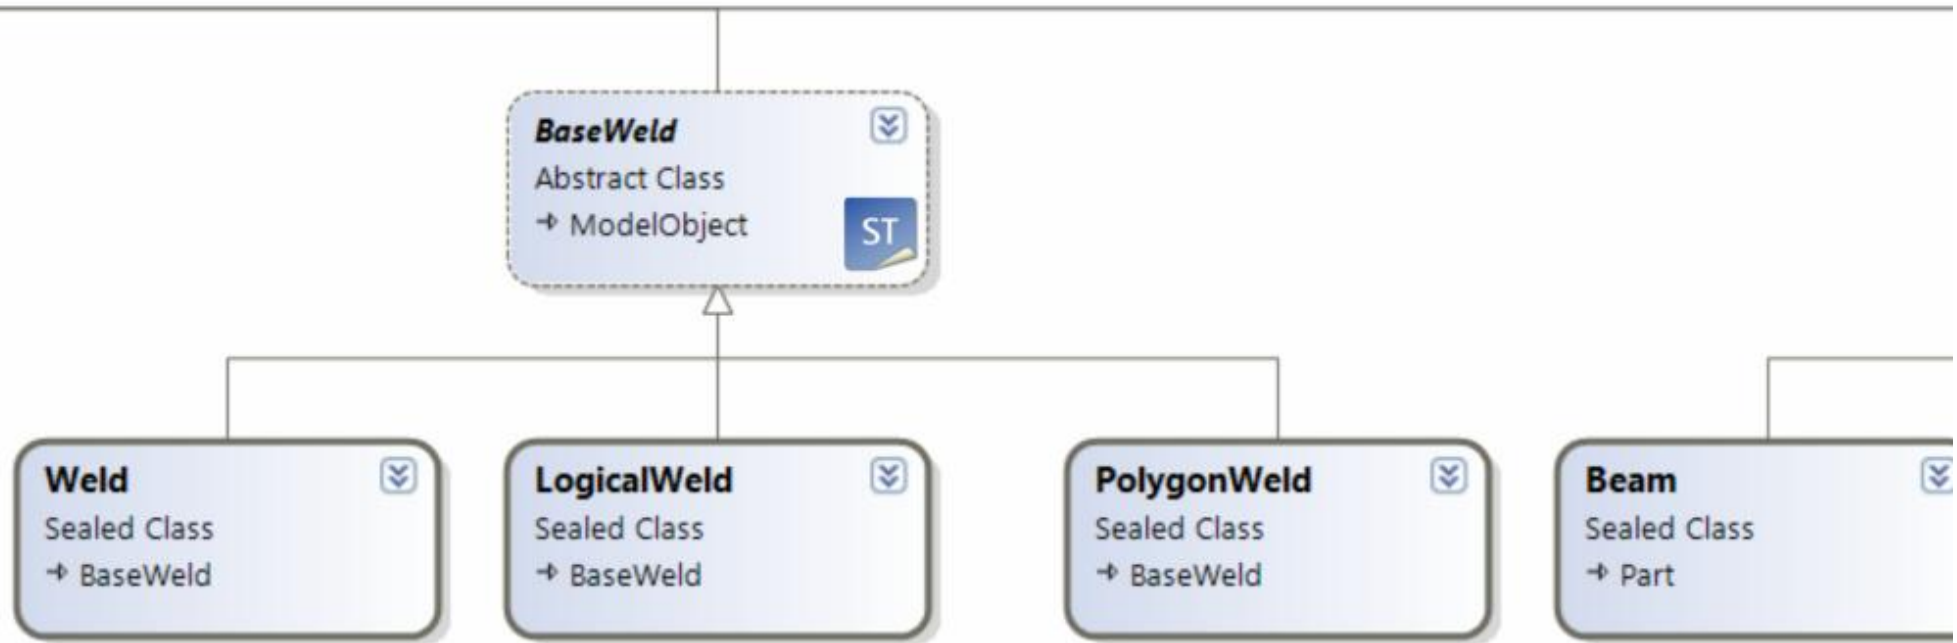

"Reinforcement" has several specialized sub-classes

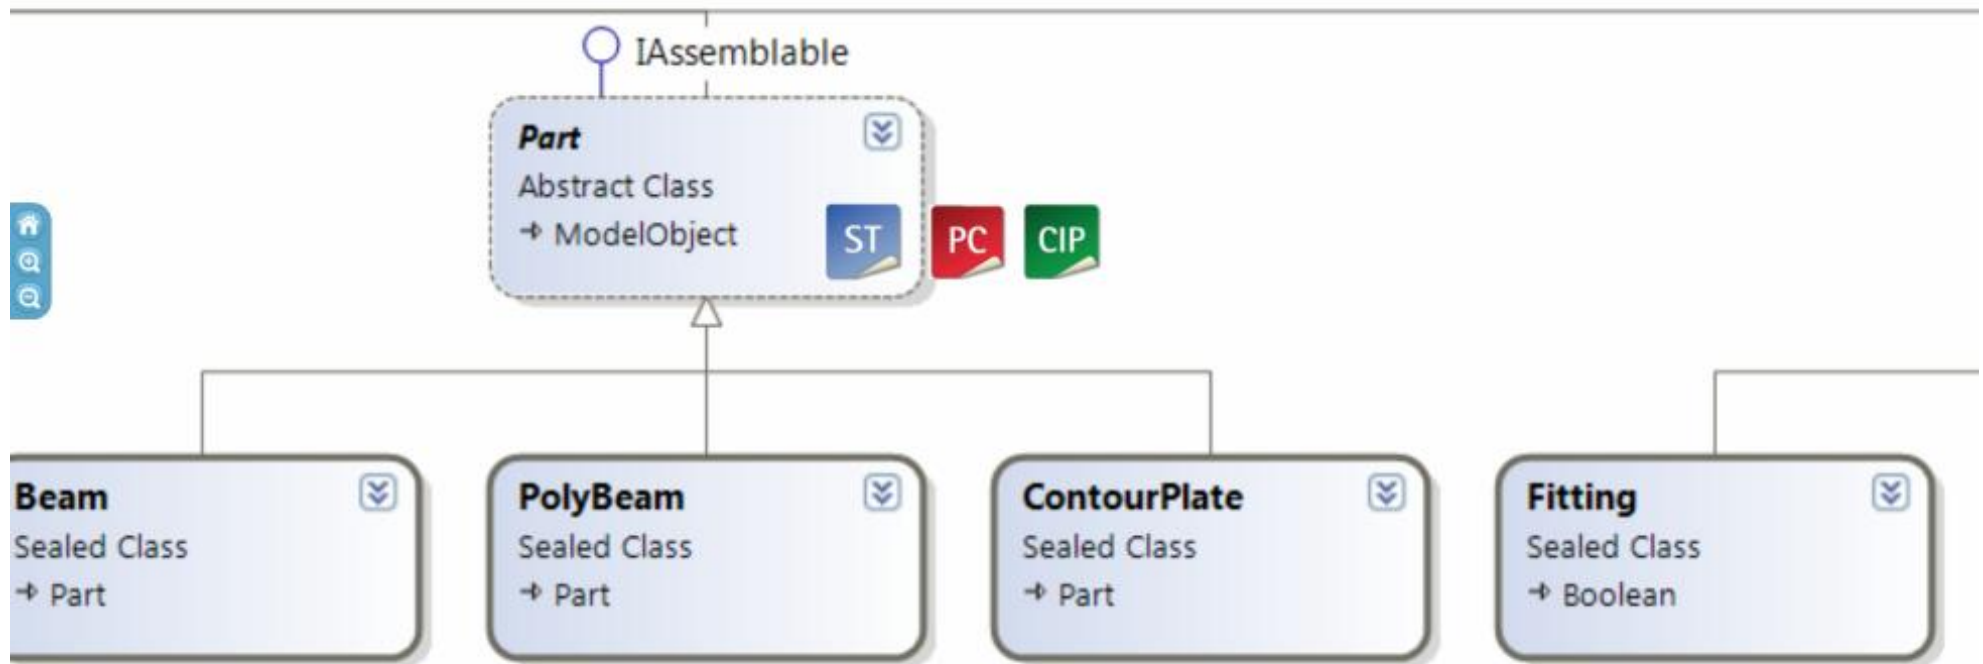

IAsemblable

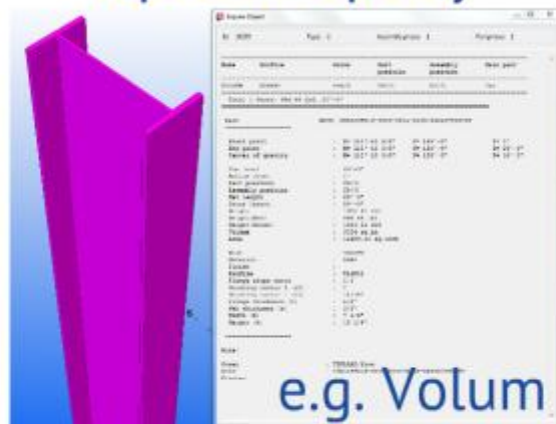

## 2 Object Properties

- User Property (UDA)

- Report Property

- [API] Class Properties

## Model Objects and Data Traversing

- > Manage Model Objects
  - > Add, delete and modify object
  - > Add, delete and change properties
- > Select and Iterate Model Objects

# Select and Iterate Model Objects

Model API provides consistent methods to:

- Select and gather objects
  - Using existing filter(s) or
  - Select by object type(s)
- Easy iteration method

## Simple Instruction

- Create a selector
- Define the selector's behavior
- Iterate through returned objects

**ModelObjectSelector methods**  
[Full documentation: class methods and methods](#)

*(There are additional documentation and examples in classes.)*  
*\*The class ObjectSelector is abstract and should not be instantiated.*

Method	Description
<code>GetAllObjects</code>	Returns an enumerator of all the model objects in the current model.
<code>GetObjectsByType</code>	Returns an enumerator of all the model objects in the current model with the given type(s).
<code>GetObjectsByTypeAndName</code>	Returns an enumerator of all the model objects in the current model with the given type(s) and name(s).
<code>GetObjectsByTypeAndNameAndLevel</code>	Returns an enumerator of all the model objects in the current model with the given type(s), name(s), and level(s).
<code>GetObjectsByTypeAndNameAndLevelAndMaterial</code>	Returns an enumerator of all the model objects in the current model with the given type(s), name(s), level(s), and material(s).
<code>GetObjectsByTypeAndNameAndLevelAndMaterialAndReference</code>	Returns an enumerator of all the model objects in the current model with the given type(s), name(s), level(s), material(s), and reference(s).
<code>GetObjectsByTypeAndNameAndLevelAndMaterialAndReferenceAndProfile</code>	Returns an enumerator of all the model objects in the current model with the given type(s), name(s), level(s), material(s), reference(s), and profile(s).
<code>GetObjectsByTypeAndNameAndLevelAndMaterialAndReferenceAndProfileAndFireRating</code>	Returns an enumerator of all the model objects in the current model with the given type(s), name(s), level(s), material(s), reference(s), profile(s), and fire rating(s).
<code>GetObjectsByTypeAndNameAndLevelAndMaterialAndReferenceAndProfileAndFireRatingAndLoadBearing</code>	Returns an enumerator of all the model objects in the current model with the given type(s), name(s), level(s), material(s), reference(s), profile(s), fire rating(s), and load bearing(s).

Code Example

C#

 Copy

```
using Tekla.Structures.Model;
using System;
using System.Windows.Forms;

public class Example
{
    public void Example1()
    {
        Model Model = new Model();

        ModelObjectEnumerator ObjectEnum = Model.GetModelObjectSelector().GetAllObjects();
        ObjectEnum.SelectInstances = false; // Set the "SelectInstances" to false to speed up the enquiry; possible because only report properties are asked.

        string Result = "CHECKED BY, CHECKED DATE, OBJECT LOCKED \n";
        while(ObjectEnum.MoveNext())
        {
            if(ObjectEnum.Current != null)
            {
                Beam BeamObject = ObjectEnum.Current as Beam;
                if(BeamObject != null)
                {
                    string CheckedBy = "";
                    double DateCheckedValue = 0.0;
                    int LockedStatus = -1;

                    DateTime DateChecked = new System.DateTime(1970, 1, 1);

                    BeamObject.GetUserProperty("CHECKED_BY", ref CheckedBy);
                    BeamObject.GetUserProperty("CHECKED_DATE", ref DateCheckedValue);
                    BeamObject.GetUserProperty("OBJECT_LOCKED", ref LockedStatus);
                    if(CheckedBy.Length > 0 || DateCheckedValue > 0.0 ||
                       LockedStatus != -1)

                        DateChecked = DateChecked.AddSeconds(DateCheckedValue);
                    Result += CheckedBy;
                    Result += ", ";
                    Result += DateChecked.ToString("dd.MM.yyyy");
                    if(LockedStatus == 1)
                    {
                        Result += ", Locked\n";
                    }
                    else
                    {
                        Result += ", Not locked\n";
                    }
                }
            }
        }
        MessageBox.Show(Result);
    }
}
```

# Code Example

I am processing large amount of data,  
how can I improve the speed of my app?

How to deal with large models?

# Optimization!

## Tips for Beginners

- > Gether objects by types and filters
- > Avoid explicitly "Select" object
  - Use report/user property if aviable
  - Set the "SelectInstance" to "false" as defulat

## Tips for Advance Users

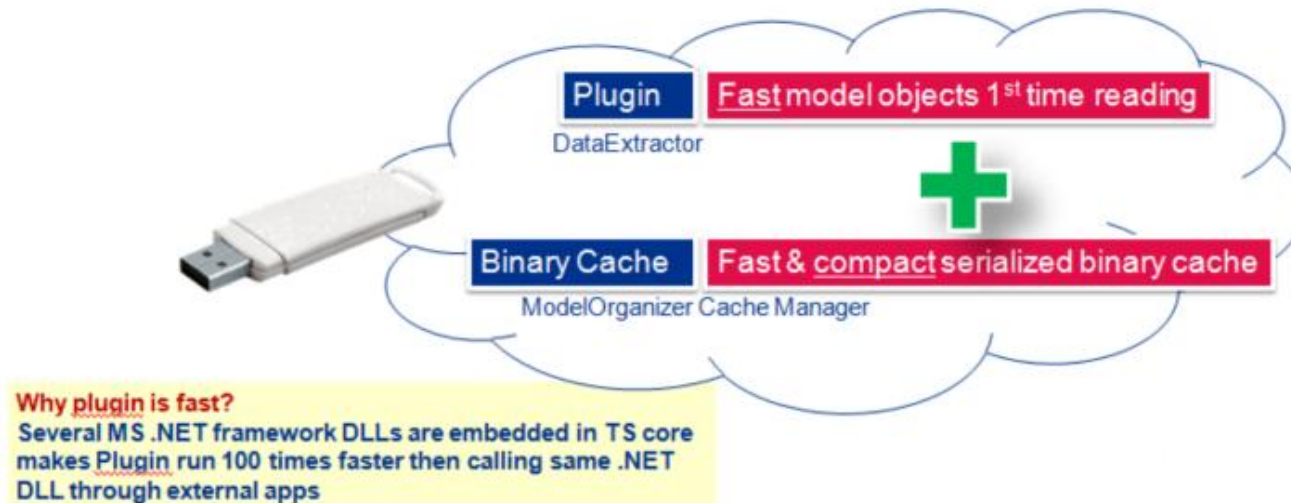

- > Consider doing the heavy work in plugin
- > Utilize caching/serialization
  - Make your cache accessible by your apps

**Why plugin is fast?**  
Several MS .NET framework DLLs are embedded in TS core  
makes Plugin run 100 times faster then calling same .NET  
DLL through external apps

# Tips for Advance Users

- > Consider doing the heavy work in plugin
- > Utilize caching/serialization
  - Make your cache accessible by your apps

 Thank You
